

Numerical methods notes

Jacopo Tissino, Giorgio Mentasti

November 7, 2019

The course is held by Michela Mapelli: a team leader in GW astronomy.

The first lessons are about basic Linux and Python, I will not take notes now, I will start later on.

Thu Nov 07 2019

1 Sorting

Useful for astrophysics since we often deal with large files.

Bubble sort We loop through the file, and swap each pair if it is not ordered.
It is $O(n^2)$ in general.

Selection sort We look for the minimum and put it at the beginning, then scan the remaining array.
It is $O(n^2)$ in general.

Quicksort

1. We pick an element, the *pivot*;
2. we reorder the array so that all elements less than the pivot come before it;
3. we do this recursively to the subarrays to the left and right of the pivot.

It is $O(n^2)$ in the worst case, $O(n \log n)$ usually.

Merge sort We divide the array into small subarrays, and merge them to produce larger subarrays.

It is $O(n^2)$ in the worst case, $O(n \log n)$ usually.
